Deaths due to Pneumonia and Influenza: During week 7, 9.2% of deaths were due, in part, to pneumonia or influenza. Compared to historical data, this is within normal limits.

School Absenteeism: During week 7, 12.3% of students at sentinel school sites were absent due to illness. Compared to historical data, this is slightly above normal limits.

State Influenza Activity: During week 7, overall influenza activity was "widespread" in California. Based on available data from 118 enrolled sentinel providers, the percentage of visits for ILI in week 7 (3.7%) does not exceed the epidemic threshold for this time of year. Nine influenza-associated deaths in adults less than 65 years of age were reported during Week 7. Twenty laboratory-confirmed influenza outbreaks were reported.

National Influenza Activity: During week 7, influenza activity decreased, but remained elevated in the United States. The proportion of outpatient visits for influenza-like illness (ILI) was 3.0%, which is above the national baseline of 2.0%. All 10 regions reported ILI at or above region-specific baseline levels. Puerto Rico and 11 states experienced high ILI activity; three states experienced moderate ILI activity; 16 states experienced low ILI activity; New York City and 20 states experienced minimal ILI activity; and the District of Columbia had insufficient data. The geographic spread of influenza in Guam and 20 states was reported as widespread; Puerto Rico, the U.S. Virgin Islands and 25 states reported regional activity; and the District of Columbia and five state reported local activity. During week 7, 7.4% of all deaths reported through the 122 Cities Mortality Reporting System were due to P&I. This percentage was above the epidemic threshold of 7.2% for week 7. Six influenza-associated pediatric deaths were reported.
